1.8° Stepper Motor

1.8° motor and driver packages now have the highest torque in the low-speed range. With Oriental Motor's higher current stepper motors and superior microstepping performance, low vibration is achieved throughout the speed range.

Revisions to the motor winding design and a high-efficiency driver circuit design allow for significant torque increases in the low-speed range. In particular, torque in the 250 r/min range has been increased by 50% compared to conventional products allowing for quicker moves. Vibration and noise have been greatly reduced compared to conventional 1.8° stepper motor performance.

● Comparison of 1.8° Stepper Motor Torque Characteristics

The maximum holding torque has increased with a bipolar winding.

● Comparison of 1.8° Stepper Motor Vibration Characteristics

The vibration characteristics have been significantly improved across all speed ranges with the fully digital-controlled microstep driver.

0.72° and 0.36° Stepper Motor

0.72° and 0.36° motor and driver packages have higher torque in the upper speed ranges. With Oriental Motor's motor technology and microstepping performance, even greater positional accuracy, lower vibration and noise are achieved.

Through revisions to the motor winding design and a high-efficiency driver circuit design, the performance of 0.72°/0.36° stepper motors has been brought to their full potential, resulting in significant increases in torque in all speed ranges. Torque in the 500 r/min range has increased by 85% compared to conventional products. In addition, the fully digital-controlled microstep driver has further improved the low vibration and noise reduction factors.

● Comparison of 0.72°/0.36° Stepper Motor Torque Characteristics

By adopting a higher current motor winding specification, the usage range is now much wider.

● Comparison of 0.72°/0.36° Stepper Motor Vibration Characteristics

Lower vibration and further noise reductions have been achieved through the use of a fully digital-controlled microstep driver.

Superior Performance with 1.8° or 0.72°/0.36° Stepper Motor and Driver Packages

A Significant Torque Increase Allows for More Applications

The maximum holding torque in the low-speed range is achieved with the 1.8° motor and driver packages through the use of a high motor current design and specification. The speed range has increased considerably with the 0.72°/0.36° packages.

Low Vibration with Full-Time Microstepping

Low vibration and noise reduction have been achieved across all speed ranges by significantly improving the vibration level with the use of a fully digital-controlled full-time microstep driver. The **CVK** Series 0.72°/0.36° stepper motor has further improved vibration characteristic.

●Reduced Step Vibration

The new smooth drive control with higher current control increases the basic step angle to a maximum resolution of 2048. As a result, a reduction in step vibration in the low-speed range is achieved.

●Vibration Suppression Control

Common vibration that occurs in the mid-speed range has been suppressed. This enables more stable torque characteristics.

CVK Series
Vibration characteristics for 0.72°/0.36° stepper motors have been further improved.

For High Positioning Accuracy Use a 0.72°/0.36° Stepper Motor

In general, stopping accuracy tends to be lower during microstep operation* than full step operation and this effect is more noticeable in a 1.8° motor. In this situation, using a **CVK** Series 0.72°/0.36° stepper motor enables a higher positioning accuracy.

*Max. resolution 125000 P/R

●Stopping Accuracy

0.72° stepper motor standard type $\pm 0.05^\circ$ (± 3 min)
0.36° stepper motor high-resolution type $\pm 0.034^\circ$ (± 2 min)

CVK Series
High positioning accuracy is now possible with 0.72°/0.36° stepper motors

●For a CVK Series 0.72°/0.36° Stepper Motor

Common Driver Installation and Wiring Allow for the Desired Performance.

There's a Wide Choice with 1.8° and 0.72°/0.36° Stepper Motors

The size, installation and I/O connectors for the **CVK Series** 1.8° and 0.72°/0.36° motor and driver packages are the same. Because of this, it is easy to evaluate and select the proper package for the requirement.

*The driver for a 1.8° stepper motor and the driver for a 0.72°/0.36° stepper motor are not interchangeable. Each motor type has a dedicated driver. Use the Step Angle Setting Switch (page 20) to set the proper resolution without changing your controller's pulse output.

High-Performance Driver in the Industry's Smallest Size Class

- Small and light driver contributes to space saving
- Protective function can detect driver abnormalities early
- Smooth drive microstepping function allows for a smooth operation
- Operation current can be set with a digital switch

Actual Size

- Name and function of each driver component

1.8° and 0.72°/0.36° Stepper Motor Packages are Similarly Priced

In addition to improving the performance and function of the **CVK Series**, prices have been revised as well. Now, the price difference between a 1.8° and a 0.72°/0.36° stepper motor is minimal.

- Comparison Between a 1.8° and a 0.72°/0.36° Stepper Motor Packages:

The **CVK** Series is a stepper motor and driver package designed for guaranteed performance. The motor product line-up includes a 1.8°, 0.72° or 0.36° stepper motor and driver with virtually identical frame sizes. The drivers are compatible in terms of functionality, operation method and installation. Furthermore, the prices of the 1.8° and 0.72°/0.36° stepper motor and driver packages are similar, making them both affordable and attractive.

● Select the optimal performance package to suit the desired specification.

Connection Diagram

When the Pulse Input is the Line Driver

* Not available on a 1.8° stepper motor. Do not connect anything to Pin No.3.

When the Pulse Input is the Open Collector

[Note on Wiring]

◇ I/O Signal Connection

● Input signal

Use 5 VDC for input signal.

When applying a voltage that exceeds 5 VDC, connect an external resistor R1 so that the current is between 5~15 mA. (AWO, CS)

When the pulse is input by an open collector and a voltage that exceeds 5 VDC for CW input and CCW input is going to be applied, connect an external resistor R3 so that the current is between 7~20 mA.

● Output signal

For output signal, please use 30 VDC, 10 mA or less. When the current value exceeds 10 mA, please connect an external resistor R2.

● Use a twisted-pair wire AWG24~22 (0.2~0.3 mm²).

● Since the maximum transmissible frequency drops as the pulse line becomes longer, keep the wiring length as short as possible within 2 m (6.6 ft.).

● Provide a distance of 100 mm (3.94 in.) min. between the I/O signal lines and power lines (power supply lines, motor lines, etc.).

◇ Power Supply Connection

● Use AWG22 (0.3 mm²) wires.

● Incorrect polarities of the DC power-supply input will lead to driver damage. Make sure that the polarity is correct before turning the power on.

◇ Extension of Motor Cable

● Use AWG22 (0.3 mm²) or thicker wires.

◇ General

● A separate hand crimp tool is required to crimp the supplied power connector included and lead wire. Accessory connection cables (sold separately) are crimped lead wires.

● If noise generated by the motor cable or power supply cable causes a problem with the specific wiring or layout, shield the cable or use ferrite cores.
